This greater understanding will help researchers develop higher efficiency advanced combustion engines strategies such as low temperature combustion, dilute (lean burn) gasoline combustion, and clean diesel combustion that produce very low engine-out emissions of oxides of nitrogen (NOx) and particulate matter (PM).

Advanced Combustion Strategies | Department of Energy

An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.
