Aggregate planning is the process of developing, analyzing, and maintaining a preliminary, approximate schedule of the overall operations of an organization. The aggregate plan generally contains targeted sales forecasts, production levels, inventory levels, and customer backlogs. This schedule is intended to satisfy the demand forecast at a minimum cost.

aggregate scheduling problem and dicusses how it may be used to experiment with a variety of problem solving strategies leading to a lowest cost solution. The emphasis is not on simply finding an optimum solution, but to provide a hands-on exploratory tool that must be built by the student. In this way, the

Aggregate Planning Problem

Optimal plans and production scenarios can be provided by solving mathematical models, which are formulated to represent these problems. This paper introduces a managerial decision support system, based on Excel spreadsheet, to deal with aggregate production planning problem. Some computational features of this tool are presented.
