Answer: The positive crankcase ventilation system, referred to as the PCV system, was one of the first pollution control devices to be used on engines. Years ago, all engines had a "breather tube." Its purpose was to remove crankcase vapors and gases from the engine. The breather tube allowed these vapors to go into the atmosphere as a known contributor to air pollution.

Positive crankcase ventilation

Common Vacuum Test Results: Normal Engine: On most engines, accelerate to around 2000 rpm and then quickly release the throttle. The engine should snap right back to a steady 17- 21"hg vacuum. Steady low between 5-10"hg vacuum: This indicates that the engine has a leak in the intake manifold or the intake gasket.

ENGINE VACUUM TROUBLESHOOTING | Classic Car Restoration Club

Check Engine Light . The engine control module (ECM) continuously monitors the environment in the engine. Using the manifold absolute pressure (MAP) sensor or mass air flow (MAF) sensor, among others, the ECM modulates fuel injector pulse, spark timing, and valve timing. If there is a vacuum leak, the ECM may be unable to compensate.

Engine Vacuum Leak: Symptoms and Solutions

An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.
