FREE Chapter 03: Digestion, Absorption, and Metabolism My ...

The key difference between metabolism and digestion is that metabolism is the complete set of biochemical reactions taking place in an organism while digestion is the breakdown of large insoluble food molecules into small molecules that can be absorbed into the bloodstream.. Both metabolism and digestion are important processes that occur in living organisms.

Difference Between Metabolism and Digestion | Compare the ...

-Carbohydrate digestion is continued with gastric amylase, resulting in disaccharides . - Protein digestion begins with pepsin (activation of pepsinogen by HCl) , resulting in peptides (small chains of protein). - Lipid digestion begins with gastric lipases which can only break down certain lipids such as butterfat , resulting in fatty acids .

The Digestive System

Explanation: The small intestine absorbs products of digestion, completes food digestion, and secretes hormones that help control the secretion of bile, pancreatic juice, and intestinal secretions. The stomach stores, mixes, and liquefies the food bolus into chyme and controls food passage into the duodenum; it doesn't absorb products of digestion.

Metabolism Questions and Answers | Study.com

Pearson correlation coefficients between the microbiota of the biliary tract and those of each upper digestive tract site were calculated by using R (v3.1.2). In order to detect differentially abundant genera and KEGG pathways in the biliary tract relative to other sampling sites, Wilcoxon rank-sum test (R project, v3.1.2) was employed to compare bile samples and the upper digestive tract samples.

Influence of the Biliary System on Biliary Bacteria ...

A: Metabolism is a term that in everyday language refers to the breakdown and transformation into energy of the foods we consume. However, metabolism is the sum of all biochemical processes that take place within an organism and includes breathing, fat storage, muscle building, digestion, and circulation of the blood.
