Written primarily for students who have completed the standard first courses in calculus and linear algebra, Elementary Differential Geometry, Revised 2nd Edition, provides an introduction to the geometry of curves and surfaces. The Second Edition maintained the accessibility of the first, while providing an introduction to the use of computers and expanding discussion on certain topics.

Such a student would be better served either by O'Neill's "Elementary Differential Geometry" or Oprea's "Differential Geometry and its Applications" (see in particular the last chapter). This is the difference between classical and modern treatments of differential geometry.

$OQ = [e, f] + t[-b, a], t \in \mathbb{R}$ with $[e, f]$ any vector solving the equation $ae + bf = d$. For $a \neq 0$, one may use $[e, f] = [d/a, 0]$, for $b \neq 0$, a simple solution has coordinates $[0, d/b]$. A solution that always works is $[e, f] = [ad/a^2 + b^2, bd/a^2 + b^2]$. Note that the parallel vector $[-b, a]$ is the hat vector to the vector $[a, b]$.

Publisher Summary. This chapter focuses on the geometry of curves in \mathbb{R}^3 because the basic method used to investigate curves has proved effective throughout the study of differential geometry. A curve in \mathbb{R}^3 is studied by assigning at each point a certain frame—that is, set of three orthogonal unit vectors. The rate of change of these vectors along the curve is then expressed in terms of the ...
