Whenever tests are performed on fiber optic networks, the results are displayed on a power meter, OLTS or OTDR readout in units of "dB.". Optical loss is measured in "dB" which is a relative measurement, while absolute optical power is measured in "dBm," which is dB relative to 1mw optical power Loss is a negative number (like -3.2 dB) while power measurements can be either positive (greater than the reference) or negative (less

FIBER-OPTICS TEST & MEASUREMENT: Specifications guide active and passive optical fiber characterization. The use of optical fibers -- in fiber lasers, for example -- is greatly facilitated by their proper characterization. The resulting data are the foundation for optimized device designs and efficient product development.

The test source should match the type fiber (generally LED for MM or laser for SM) and wavelength (850, 1300, 1550 nm) that will be used on the fiber optic cable you are testing. If you are testing to some standards, you may need to add some mode conditioning, like a mandrel wrap, to meet the standard launch conditions.

The FOA Reference For Fiber Optics - Fiber Optic Testing reflectometer (OTDR) is the back reflection, portable optical test set used in the field for pre and post-construction fiber measurements. The backscatter concept is illustrated in Figure 1. Note: Following the OTDR manufacturer's instructions, set the fiber group index to 1.4670 for measurements at 1310 nm and 1.4675 for measurements at 1550 nm.
