GE's aeroderivative gas turbines are widely used to drive compressors at production sites. They typically run on raw gas taken directly from the well head. For gas lift, the compressor injects gas into an oil well casing where it passes through lift valves at various elevations causing oil to be lifted out of the well.

GE's aeroderivative gas turbines are designed to operate on full load, despite low gas pressure, high humidity, dust load, and altitude. The generated energy can be used in the coal mine to meet electricity requirements or fed into the public power grid. Thermal energy can be used for onsite heating or fed into a district heating system.
